

# VACCINE FAQs

## Will the vaccine give me COVID?

No. The vaccines are not made using live virus, so you will not get COVID-19 from the vaccine. You may experience mild symptoms like fatigue, a sore arm, headache, or nausea - but these will go away in a few days.

## How does the vaccine work?

There are three types of vaccines that have been authorized by the Food and Drug Administration (FDA) for emergency use or FDA-Approved in the U.S. so far: Pfizer (FDA-Approved), Moderna, and Johnson & Johnson. Each of them teach the body to recognize the virus so it can be fought off if the body detects the infection in the future.

## Stay Safe

It takes about two weeks once you are fully vaccinated to reach full protection. Stay safe, keep masking up and practicing social distancing!

## How was the vaccine made so fast?

The clinical trials for U.S. authorized vaccines involved thousands of volunteers who were found to have high levels of protection against the COVID-19 virus after being fully vaccinated. The clinical trials found the vaccines to be safe and effective before shots were made available to the American public.

After the SARS (Severe Acute Respiratory Syndrome) outbreaks in 2003, scientists in the United States and elsewhere began working on vaccines that would prevent similar corona viruses from making people sick. When a new corona virus, COVID-19, was detected in late 2019, scientists were able to develop COVID-19 vaccines quickly because of years of previous research on related viruses and faster ways to manufacture vaccines, enormous U.S. government funding that allowed firms to run multiple trials in parallel, and regulators moving more quickly than usual.
